What happens when one label on a panel carries a different serial number than the rest?

Manual visual checks slow down your line and still let mismatched panels slip through. Worse, when a customer complains months later, there is no proof of what left your factory.

THE SOLUTION: MATCH MULTIPLE BARCODES

Multiple barcodes. One verdict. Every panel.

It reads every barcode on a panel, checks that they agree, and tells the operator PASS or FAIL within seconds. Every failure comes with picture evidence and a full record.

HOW IT WORKS

1 Scan
Scanners read the barcodes on each panel as it arrives.

2 Compare
The station checks that every barcode reads and that they all agree.

3 Decide
The operator sees PASS or FAIL. The alarm light shows a failed panel.

4 Record
Result, pictures and history go to the central server and your MES.

WHAT YOU GET

- **An unmistakable verdict**
  Match, mismatch, no-read and timeout each get their own status, so nobody has to guess what went wrong.
- **An alarm the line can see**
  A steady light for a failed panel, a slow blink for a scanner problem, and an optional sound for a good panel.
- **Evidence for every failure**
  Pictures of a failed panel are kept and linked to its record. Open one months later and see why it failed.
- **One view across every station**
  Live station status, results, failure reports and a search by serial number, all on one central server.
- **Keeps running when the network does not**
  Each station works on its own and sends everything to the server automatically when the connection is back.
- **Control without chaos**
  PIN sign-in with roles. Supervisors can rescan or override with a reason, and every action is logged.

BUILT TO FIT YOUR LINE

Scanner out for service? Switch it off in the settings and the station keeps verifying with the rest.

Connects to your MES. Passed panels are sent automatically, with retries if the MES is busy.

Simple to roll out. One settings file install or updates a station or the server, with checks before anything changes.

Years of evidence kept compact. Pictures are compressed on the server and kept for as long as you choose, up to five years by default.
